1. Introduction

UI Importer Free (compatible with Figma) is a Unity Editor extension that converts UI layout JSON exported from Figma into Unity UI (uGUI) Prefabs. It works with the companion Figma export plugin to bridge your designs and Unity's uGUI system.

This is the **Free** edition with a limited feature set. For full functionality, please consider upgrading to the **Pro** edition.

2. Requirements

- Unity 6 or later
- TextMeshPro package
- uGUI (UnityEngine.UI)
- Companion Figma export plugin

3. Installation

1. Import the **UI Importer Free (compatible with Figma)** package from the Unity Asset Store.
2. Ensure TextMeshPro is installed in your project. If not, go to **Window > TextMeshPro > Import TMP Essential Resources**.

4. Setup Guide (Step-by-Step Tutorial)

Step 1: Get Authorization Code (First Time Only)

1. In Unity, go to **Assets > UI Importer Free > Create Authorization Code**.
2. A window will appear displaying an authorization code.
3. Copy this code and paste it into the Figma plugin's authorization field.

Step 2: Configure Import Settings (Optional)

1. Go to **Assets > UI Importer Free > Create Settings**.
2. This creates an **ImportSettings** ScriptableObject in your project.
3. Configure font mappings: map Figma font names (e.g., "Inter") to TMP_FontAsset references in your project.

Step 3: Export from Figma

1. Open the companion Figma export plugin in Figma.
2. Select the frame(s) or layer(s) you want to export.
3. Click **Export** to generate a UI_LayoutData.json file and associated image assets.

Step 4: Import into Unity

1. Place the exported JSON file and all image assets into your Unity project's **Assets** folder.

2. In the Project window, right-click the JSON file.
3. Select **Assets > UI Importer Free > Create Prefab**.
4. One prefab per root node will be generated in the same directory as the JSON file.

5. Supported Features (Free)

The Free edition supports the following subset of features:

Source Feature	Unity Component	Notes
Image / Export	Image + Sprite	Automatic sprite lookup by filename
Fill Color	Image	Solid color background
Text	TextMeshProUGUI	Font, size, color, alignment, line height, letter spacing, bold/italic, overflow
Opacity (with children)	CanvasGroup	Alpha for entire hierarchy
RectTransform (basic)	RectTransform	Position, size, rotation

In the Free edition, all child elements are placed flat under the root object (no nested hierarchy).

6. Free Edition Limitations

The following features are available only in the **Pro** edition:

Pro-only Feature	Description
9-Slice	Image.Type.Sliced with sprite border
Auto Layout	HorizontalLayoutGroup / VerticalLayoutGroup
Mask / ScrollRect	Mask, RectMask2D, ScrollRect
Hierarchy Reproduction	Parent-child structure matching source layers
Constraints	RectTransform anchoring (MIN/CENTER/MAX/STRETCH/SCALE)
Button Auto-Detection	Button component auto-added by name prefix

7. Font Resolution

Fonts are resolved in the following priority order:

1. **Settings Font Mappings:** User-defined Figma font name to TMP_FontAsset mapping in **ImportSettings**.
2. **Asset Name Search:** Searches the project for a TMP_FontAsset whose name matches the Figma font family name.
3. **Any TMP_FontAsset:** Uses the first available TMP font found in the project (warning is displayed).
4. **TMP Default Font:** Falls back to TextMeshPro's built-in default font (warning is displayed).

8. Script Reference

8.1 UllImporter (Static Class)

Location: Editor/UllImporter.cs

Main importer class, accessed via the Unity menu.

- **Assets > UI Importer Free > Create Prefab** — Reads the selected JSON file and generates Unity UI prefabs. Each root node becomes a separate prefab. In the Free edition, all descendants are flattened under the root.

8.2 ImportSettings (ScriptableObject)

Location: Editor/ImportSettings.cs

Stores import configuration (one instance per project).

- **Assets > UI Importer Free > Create Settings** — Creates a new **ImportSettings** asset.

Properties:

fontMappings (FontMapping[])

An array of font mappings. Each entry maps a Figma font name (string) to a TMP_FontAsset reference.

8.3 FontMapping (Serializable Class)

Defined inside **ImportSettings**.

figmaFontName (string)

The font family name as it appears in Figma (e.g., "Inter", "Roboto").

fontAsset (TMP_FontAsset)

The corresponding TextMeshPro font asset in your Unity project.

8.4 AuthorizationCodeWindow (EditorWindow)

Location: Editor/AuthorizationCodeWindow.cs

- **Assets > UI Importer Free > Create Authorization Code** — Opens a window displaying the authorization code required by the companion Figma export plugin.

9. Troubleshooting

Q: The prefab is not generated after selecting "Create Prefab."

Ensure the selected file is a .json file exported by the companion Figma export plugin.

Q: Images are missing in the generated prefab.

Make sure all exported image files are placed in the Unity Assets folder before creating the prefab. The importer searches for sprites by filename.

Q: Fonts are not matching correctly.

Create an **ImportSettings** asset and configure font mappings to explicitly map Figma font names to your TMP_FontAsset files.

Q: My layout looks flat, missing the original hierarchy.

The Free edition intentionally flattens all child elements under the root. Hierarchy reproduction is a Pro-only feature.

10. Support
